## Metabolomica e microbioma

Francesco Capozzi

*Department of Agricultural and Food Sciences  
Alma Mater Studiorum - University of Bologna*

Bologna, 22<sup>nd</sup> March 2022

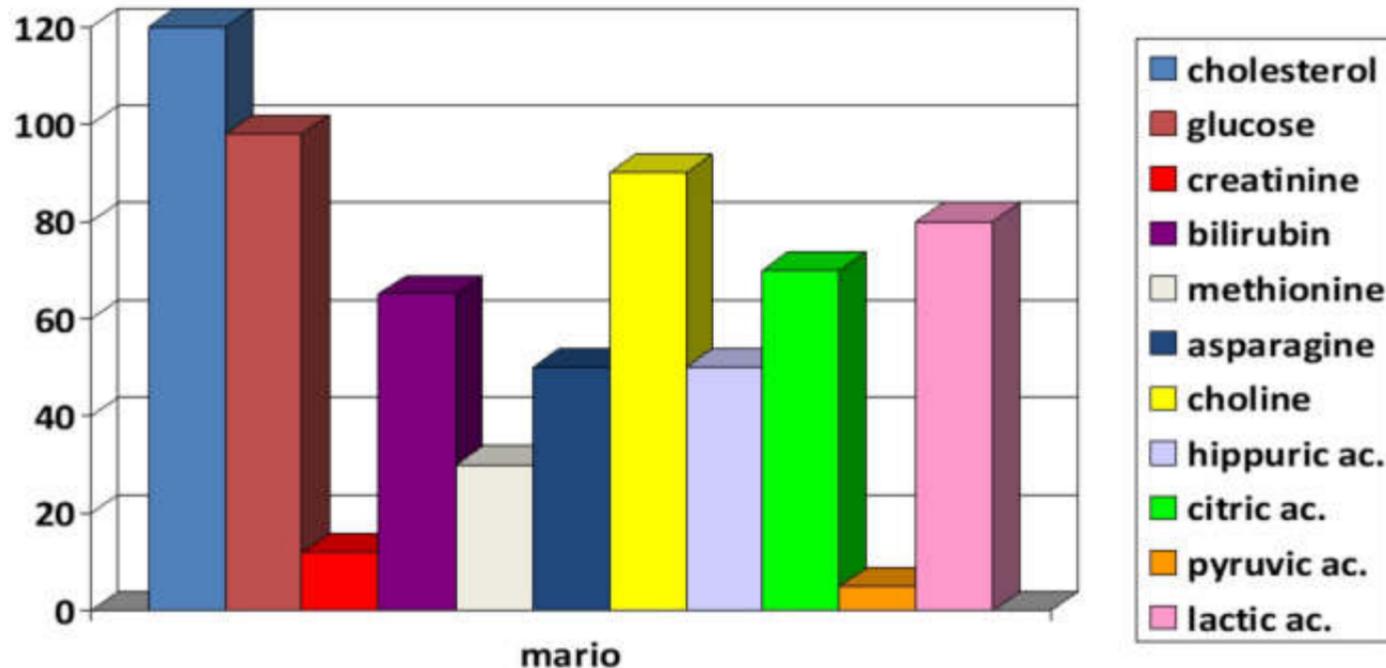

# THE METABOLOME

- **Metabolites:** molecules and other chemical species of small size (< 1 kDa) present in biological systems by transfer from the external environment or produced by metabolic reactions.
- **Metabolic Profile:** description (tables, histograms, graphs, etc..) of a biological system based on the list of metabolites present in it, and their corresponding quantity.
- **Metabolome:** The complete set of metabolites present in a (super)organism or in a tissue/organ, including biological fluids, as described by holistic methods.

# CONVENTIONAL METABOLIC PROFILE

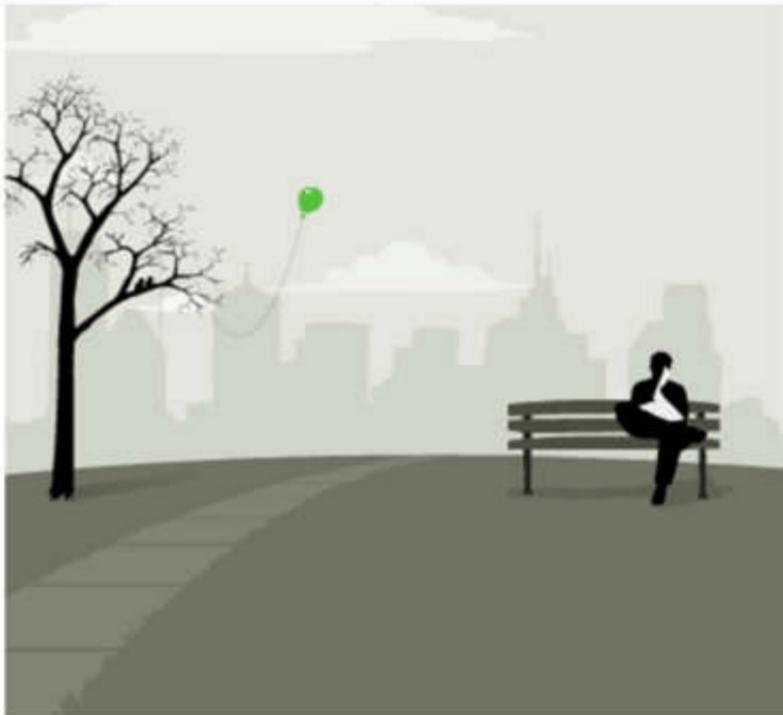

# METABOLOMICS O METABONOMICS ?

- **MetaboLomics:** studies the entire metabolome of an organisms through holistic techniques, including comparative analyses between species or groups of individuals. The purpose is to understand the metabolic phenotype arising from the specific genome of an individual.
- **MetaboNomics:** “quantitative measure of the dynamic multi-parametric metabolic response of living systems to pathophysiological stimuli or genetic modification” (J.K. Nicholson, Xenobiotica, 1999, 29, 1181). The purpose is to understand the metabolic perturbations relating to the interaction between the individual genome and its environment.
- **In both cases:** the basic requirement is the absence of *a priori* selection of the metabolites to be searched.

# METABOLOMICS

**Detailed, comprehensive description of the whole metabolome, without emphasis on any particular metabolite**

(even the number and length of blades of grass are meaningful for the complete description of the picture)

# METABONOMICS

Analytical Methods  
(Target Analysis)

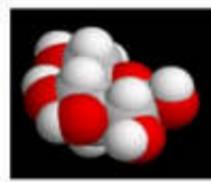

Chemometric Methods  
(Pattern Analysis)

# CLASSIFICATION: FINDING GROUPS OF INDIVIDUALS

- █ cholesterol
- █ glucose
- █ creatinine
- █ bilirubin

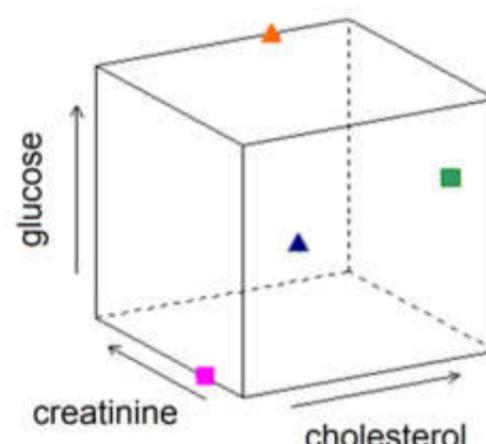

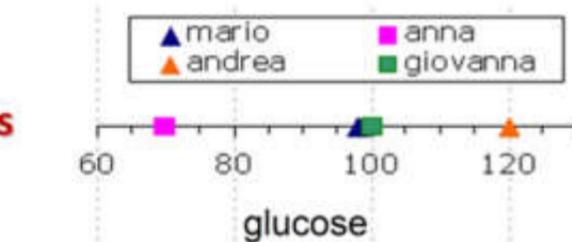

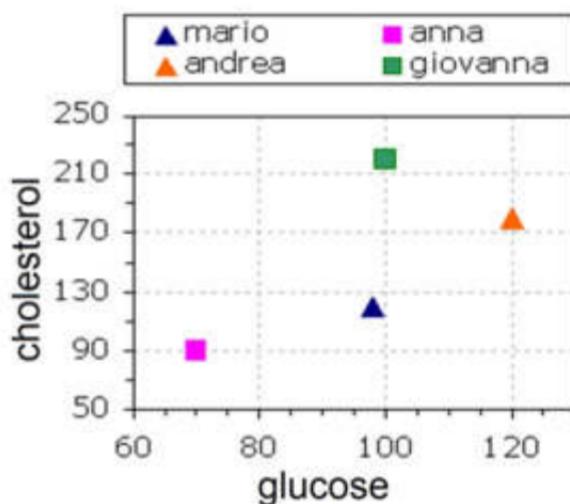

Is there any cluster?

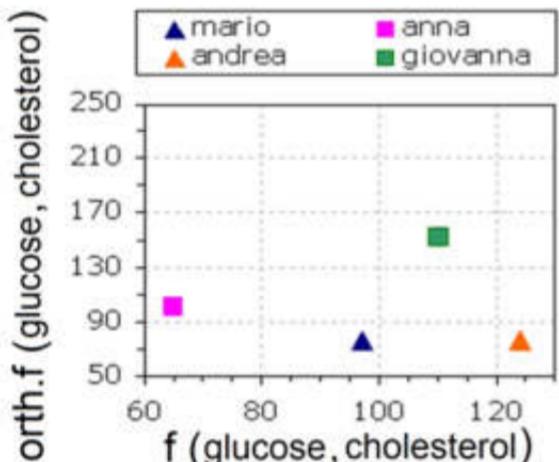

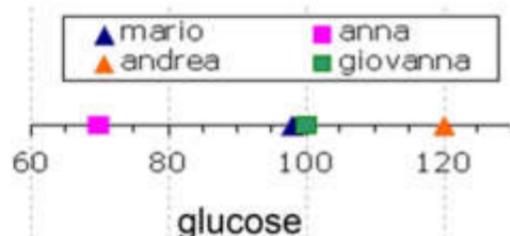

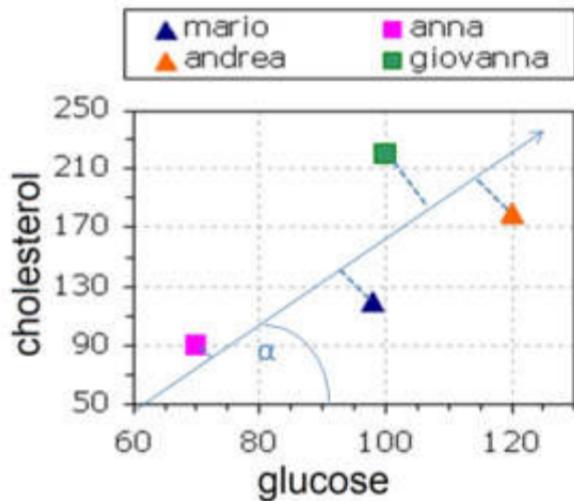

# REPRESENTING DIFFERENT INDIVIDUALS (1,2,3-D)

First step: measure the distance between individuals

# REDUCING THE DIMENSIONALITY OF REPRESENTATIONS

(2-D → 1-D)

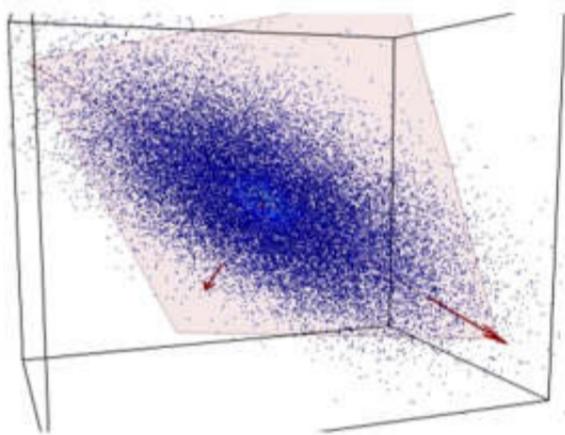

# MULTIVARIATE STATISTICAL ANALYSIS

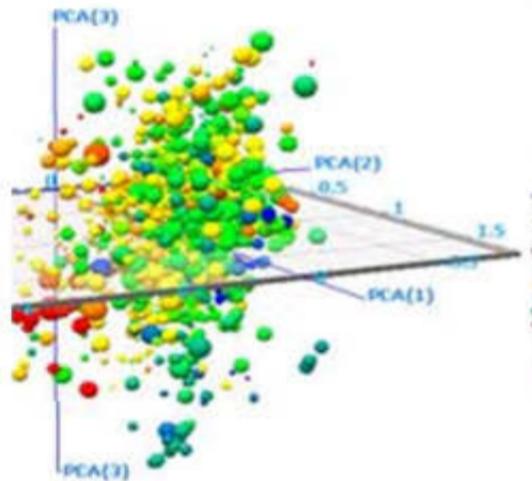

$$Y = P \cdot X$$

$$\begin{pmatrix} Y_{11} & Y_{12} & Y_{13} & \dots & Y_{1n} \\ Y_{21} & Y_{22} & Y_{23} & \dots & Y_{2n} \\ \vdots & \vdots & \vdots & \ddots & \vdots \\ Y_{m1} & Y_{m2} & Y_{m3} & \dots & Y_{mn} \end{pmatrix} = \begin{pmatrix} p_{11} & p_{12} & \dots & p_{1m} \\ p_{21} & p_{22} & \dots & p_{2m} \\ \vdots & \vdots & \ddots & \vdots \\ p_{m1} & p_{m2} & \dots & p_{mm} \end{pmatrix} \cdot \begin{pmatrix} x_{11} & x_{12} & x_{13} & \dots & x_{1n} \\ x_{21} & x_{22} & x_{23} & \dots & x_{2n} \\ \vdots & \vdots & \vdots & \ddots & \vdots \\ x_{m1} & x_{m2} & x_{m3} & \dots & x_{mn} \end{pmatrix}$$

$y_{12} = (p_{11}, p_{12}, \dots, p_{1m})$  dot-product  $(x_{12}, x_{22}, \dots, x_{m2})$

Mathematical transformations to reduce the space to a smaller number of dimensions

# MS vs. NMR COMPARISON

12

M.Jacob et al. Metabolomics toward personalized medicine. *Mass Spec Rev.* 2019; 38: 221–238.

Direct Infusion-Tandem Mass Spectrometry

	NMR	GC-MS	DI-MS
<b>Sample prep time</b>	30 -120 min/20 samples	30 -120 min/20 samples	3-4 h for 96 samples
<b>Run time</b>	20 -90 min/sample	30-60 min/sample	7 min/sample
<b>Data Analysis</b>	30-60 min / sample	30-60 min / sample	1-2 h for 96 samples
<b>Limit of Detection</b>	~ 5 µM	~ 100 nM	~ 5 nM
<b>No. of metabolites</b>	~ 20 - 50	~20 -50	~ 100-180
<b>Overlapping Metabolites</b>	10-15	10-15	10-15
<b>Cross-checking</b>	10-30 %	10-30 %	10-30 %

# WHY NMR ?

Advantages	Disadvantages
Nondestructive	Not very sensitive ( $>1\text{-}5 \mu\text{M}$ )
Fast	Expensive Instrumentation
Quantitative	Require large samples ( $>500 \mu\text{l}$ )
Requires no Separation	
Detects all organic classes	

# USING NMR FOR METABOLOMICS

14

NMR spectroscopy is expensive: thus find a true reason to use it!

Metabolomica e microbioma by [Francesco Capozzi](#) is licensed under a

# WHY NMR ?

- **Organisms or tissues:** NMR can analyze heterogeneous mixtures, either solid or semisolid, without any particular preparation.
- **Biological Fluids:** NMR can analyze and return the intact samples of CSF, serum, plasma and urine (centrifugation is only required).
- **Cell extracts:** NMR can analyze, without further manipulation, homogeneous mixtures whose composition differ depending on the extraction solvent.
- **Feces:** simple preparation consisting of homogenization by stirring for few minutes with buffer or 95% ethanol, then centrifuged for 2 h at  $35\,000 \times g$  at  $4\text{ }^{\circ}\text{C}$ .

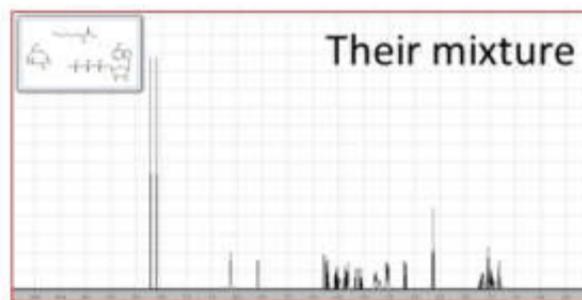

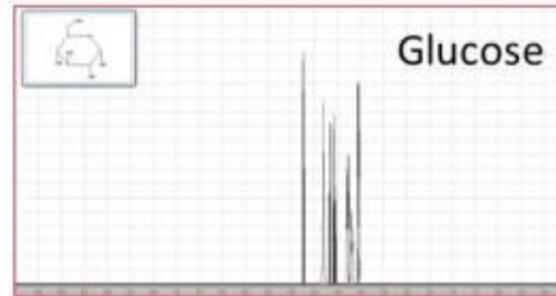

# WHY FECES ?

Fecal material contains both **endogenous and exogenous metabolites** with variant polarity, e.g., nonpolar fatty acids, triglycerides, and phosphoglycerolipids, and polar compounds, such as **short chain fatty acids** (SCFAs), amino acids, bile acids, and carbohydrates. In addition, feces contain both microbial and mammalian cells. Fecal samples provide direct information about **interactions between host and gut microbiota** since they carry numerous biochemical compounds derived from the host, the host's microbiota, and food residuals.

# NMR SPECTRA OF METABOLITES AND THEIR MIXTURES

19

Acquisition of other nuclei may resolve the overlapping signals corresponding to different metabolites

<sup>1</sup>H NMR

<sup>31</sup>P NMR

# RELIABILITY OF NMR DATA

## NMR Spectroscopic Data

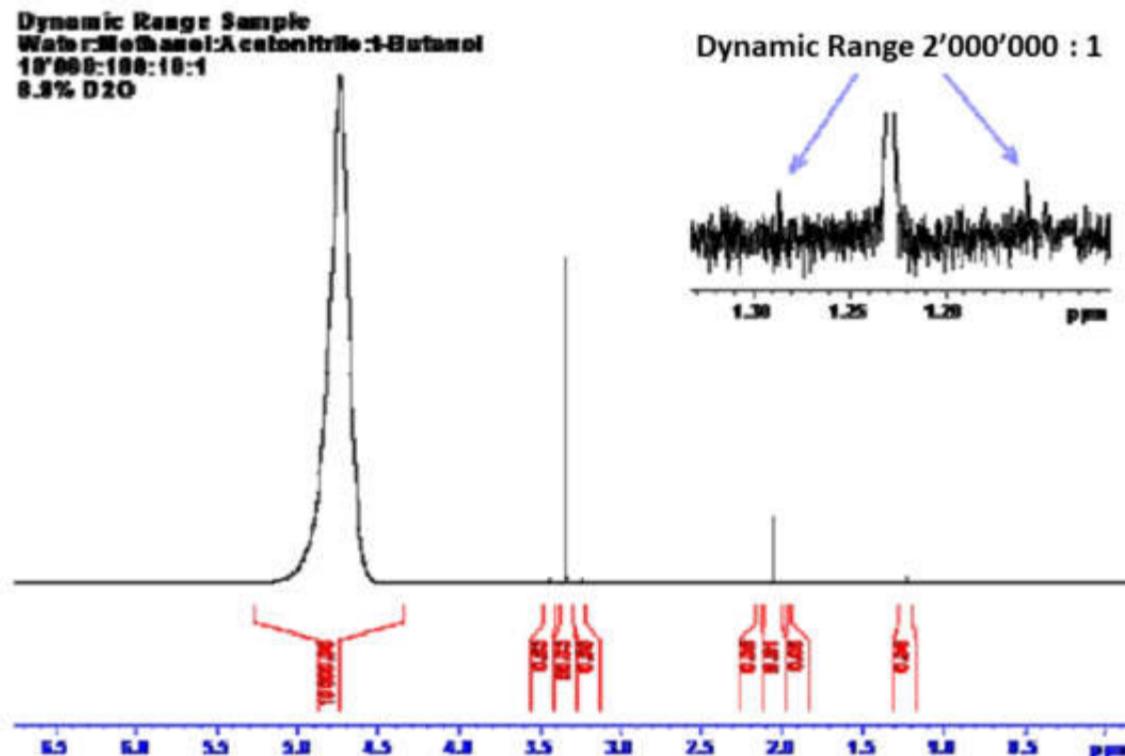

The NMR spectrum is directly useable for representing each individual, because the NMR spectra acquired, over time, on a kinetically stable sample are repeatable and perfectly superimposable.

## HPLC-MS or GC-MS Data

The metabolome is represented by derived data, organized in tables, because the chromatogram trace is not sufficiently repeatable even for the same kinetically stable sample.

The discrimination identifiable by PCA and O-PLS-DA analysis of the entire data set (Figure 1) indicated that the major source of metabolite spectral variation was at the level of the participant, followed by day of collection, and then time of day of collection.
